Direct Submission
Submitted (12-APR-2000) to the EMBL/GenBank/DDBJ databases
This sequence is a single read and was generated as part of a large
scale clonne-end sequencing project of the Tetraodon nigroviridis
genome. For more information, please take a look at

Submitted (02-JUN-1999) Genoscope - Centre National de Sequencage :
- Web : www.genoscope.cns.fr)
- Determination of this BAC-end sequence was carried out as part of collaboration with the BAC-end sequence was carried out as part of a release permination of the Bocsephila Genome Project (BDGP).

The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fruitfly.org The BDGP Prosophila haron melanogaster BAC library was prepared by Kazutcyo Osoegawa and Aaron Mammoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, BY. The library is named RPCI-98 and was constructed by partial isogenic strain v2; cn bw sp, the same strain used for the BDGP's and how to order individual BAC clones, the entire library filters for Mybridization from the BACPAC Resource Center can be found at http://bacpac.med.buffalo.edu/drosophila_bac.htm.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

This GSS is part of a random genomic sequencing program of thirteen
yeast species: Saccharomyces bayanus var. uvarum, Saccharomyces
Saccharomyces kluyveri, Kluyveromyces thermotolerans, Kluyveromyces
lactis var. lactis, Kluyveromyces thermotolerans, Kluyveromyces
angusta, Debaryomyces hansenii var. hansenii, Pichia sorbitophila,
Candida tropicalis and Yarrowia lipolytica. Genomic inserts of 3 to
keywords for description of this sequence and for the sequence of
the other extremity of this insert.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 4, Al

present invention describes a vector a high copy number origin of restrate Claim 43; Page 93-96; 102pp; English

(a) a high copy number origin of replication (Ori) having at least one cloning site, with at least one cloning site being positioned in the high copy number ori such that the ability of the high copy number Ori to direct replication is not disrupted when no insert has been cloned into the cloning site and is disrupted when an insert is cloned into the cloning site and is disrupted when an insert is cloned into the cloning site; and (b) a low copy number ori. Also described is a truncated Lacz gene to disringuish cells with the truncated Lacz gene to disringuish cells with the truncated Lacz gene to disribute when grown on medium containing Xgal and IPTG. Products and methods from the present invention can be used for the manipulation of DNA. They can be used for sequencing large regions of DNA and mapping the locations of markers within large regions of NB. The present sequence represent a specifically claimed vector following: comprising the sequence from the present invention.

A method has been developed for raising salt tolerance of plants using transgenic technology. The method comprises: cloning levansucrase gene SacB and vacuole guide peptide (cpy) sequence of carboxypeptidase A from Bacillus and DNA of yeast, using the two kinds of gene to create a chimeric gene, and using the chimeric gene to structure plant expression plant and screen for resistant seedlings. The method can obtain a drought-resistant salt-tolerance plants, and the polymerase chain reaction (PCR) and Northern analysis of transgent plants shows that the exogenous gene is integrated in the salt-tolerance transgenic plant. The present sequence represents a SacB and cpy chimeric gene from the

A method has been developed for raising salt tolerance of plants using transgenic technology. The method comprises: cloning levansucrase gene SacB and vacuole guide peptide (cpy) sequence of carboxypeptidase A from Bacillus and DNA of yeast, using the two kinds of gene to create a chimeric gene, and using the chimeric gene to structure plant expression plant and screen for resistant seedlings. The method can obtain adrought-resistant salt-tolerance plants, and the polymerase chain reaction (PCN) and Northern analysis of transgenic plants shows that the exogenous gene is integrated in the salt-tolerance transgenic plant. The present sequence represents a SacB and cpy chimeric gene from the

```
The invention relates to isolated polynuclectide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymerase data also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynuclectide sequences have applications in capposities, for generic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and canno acid sequences. AAS6419-AAS94564 represent novel human conditional partners are discussed and polynuclectide sequences of the invention.

Committee the sequences data for this partent did not appear in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   5,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        cacaagaatggtcaggatcagctgttttgaacagtgataactctatccaattattttata 1042

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chair reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The colynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations capponsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic coding sequences of the invention.

Note: The sequence data for this patent did not appear in the printed security in the activity in the activity of the contract of the product of the product of the product of the product of the printed of the contract of the product of the product of the printed of the contract of the product of the printed of the product of the printed of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the prod

polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymuclocides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving to restore normal activity of (II) or to treat disease states involving continues and its binding parthers are useful in medical actor as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical disorders involving aberrant protein expression or biological activity. The polypeptide and polynuclectide sequences have applications in casponsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and diagnostic coding sequences of the invention.

Conditional and polynucleotide sequences of the invention.

Conditional activity of the invention.

Coding sequences of the invention.

Coding sequences of the invention.

Coding sequences of the invention.

Coding sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO contribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      S.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              cacaagaatggtcaggatcagctgttttgaacagtgataactctatccaattattttata 1042

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, and polymerase chain reaction (PCR) primers, oligomers, and for chromosome polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving quantitating a polypeptide in tissue, as molecular weight markers and as food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating at language of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity.

```

```
The polypeptide and polynucleotide sequences have applications in responsible, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. AAS64197-AAS94564 represent novel human Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp. Wipo.int/pub/published_pct_sequences.

The invention relates to isolated polynuclectide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome configurates enhanced reaction (PCR) primers, oligomers, and for chromosome configuration of (II). The mapping, and in recombinant production of (II). The christian generating expressed genes. (I) is useful in gene therapy techniques (I) constone normal activity of (II) or to treat disease states involving to restore normal activity of (II) or to treat disease states involving or constituting a polypeptide in tissue, as molecular weight markers and as imaging of sites expressing (II). (II) and its binding partners are useful in medical cisorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in cresponsible for genetic disorders or other traits to assess biodiversity amon acid sequences. AASA4197-AAS4454 represent novel human conditioning sequences of the invention.

Conditioning the printed in electronic format directly from WIPO the first of this patent did not appear in the printed constitution of the constitution of Claim 1; SEQ ID No 24540; 103pp; English.
